Network Security

- **What:** protecting network from an attack

Ransomware hits Telangana and Andhra Pradesh power department websites

Mahesh Buddi / TNN / Updated: May

The computer systems of Telangana Ransomware attacked the systems Officials in the Telangana power de

1.3 TB data encrypted and five servers affected in AIIMS ransomware attack: Centre

CERT-In and other stakeholder entities have advised necessary remedial measures, Minister tells Rajya Sabha

India Recorded 79 Million Cyber Attacks In 2023, Ranks 3rd Globally: Report

*decentralization
↑
security*

- **Historical perspective:** Internet was not designed with in mind (?)
 - Patches added to provide cybersecurity

Computer security is Network security

What kinds of network attacks?

① Phishing

- ① Spoofing
- ② Eavesdropping
- ③ Denial of Service
(Bring down of availability)
- ④ Modification of data

① Eavesdropping

↳ confidentiality

② Modification of data
(Message integrity)

③ Spoofing ; Authentication

④ Access & availability

What is network security?

Encryption → Cryptography

confidentiality: only sender, intended receiver should “understand” message contents

- sender encrypts message
- receiver decrypts message

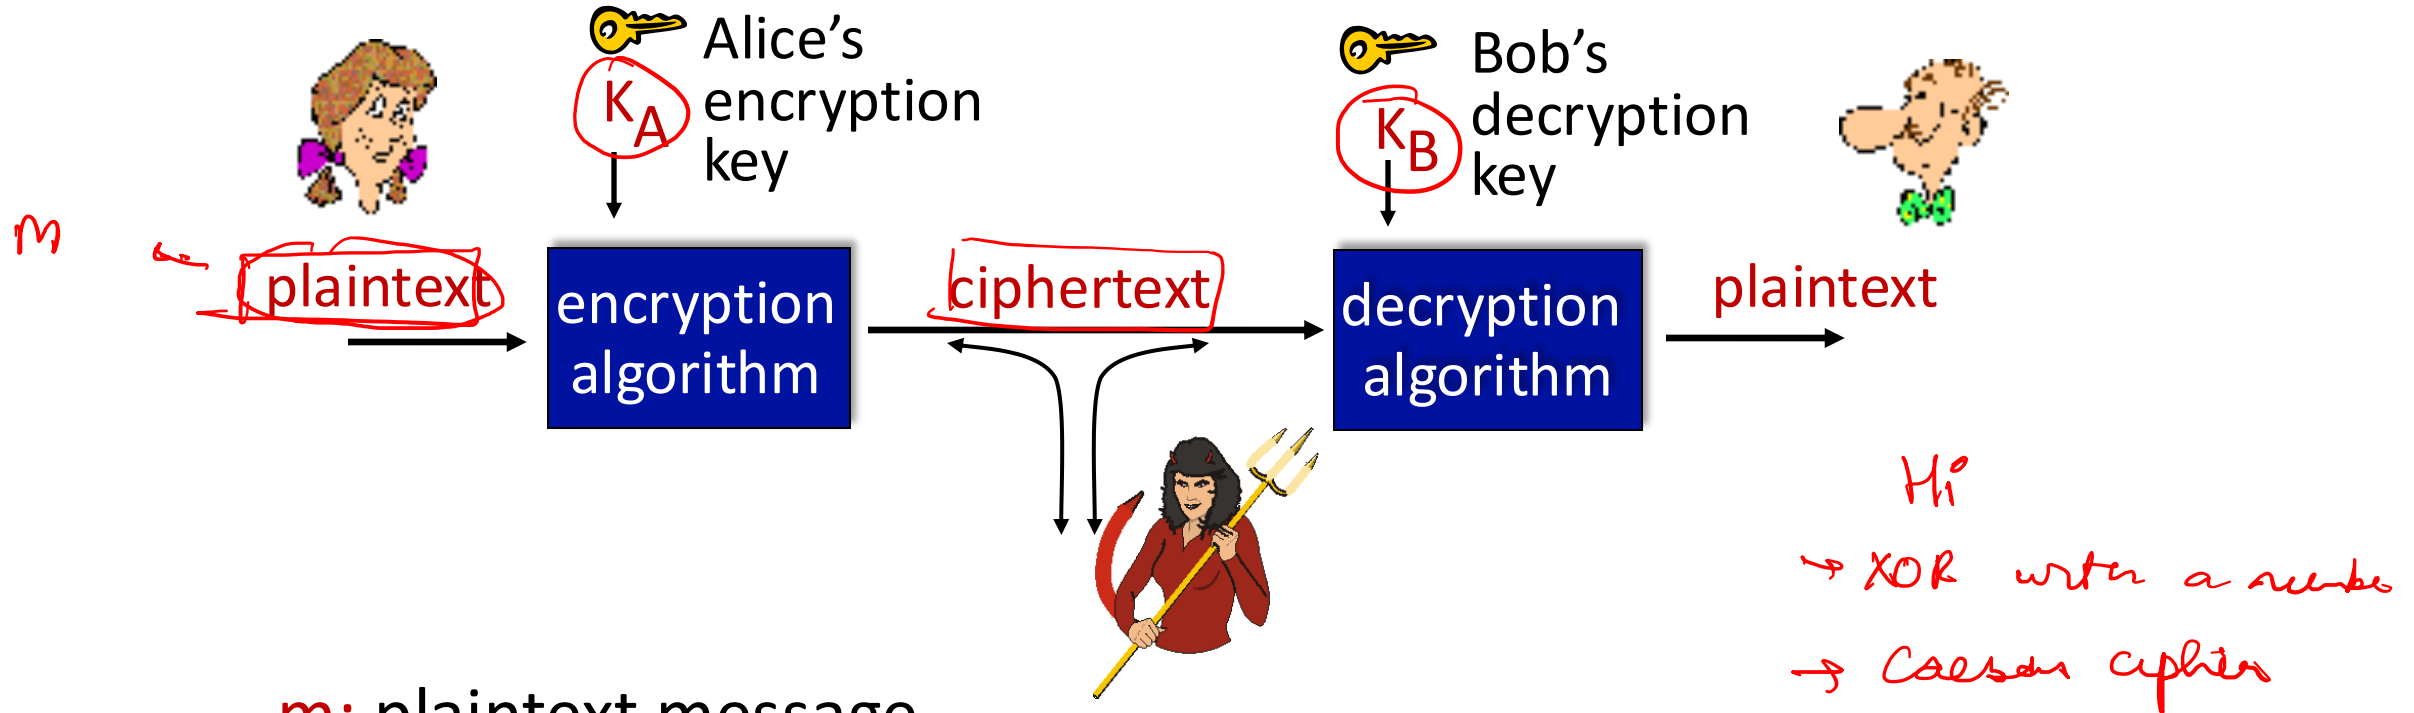

authentication: sender, receiver want to confirm identity of each other

message integrity: sender, receiver want to ensure message not altered (in transit, or afterwards) without detection

access and availability: services must be accessible and available to users

Providing confidentiality

$K_A = K_B$: Symmetric encryption Algorithm

m : plaintext message

$K_A(m)$: ciphertext, encrypted with key K_A

$m = K_B(K_A(m))$

Symmetric key cryptography

symmetric key crypto: Bob and Alice share same (symmetric) key: K

Symmetric key cryptography (example)

substitution cipher: substituting one thing for another

- monoalphabetic cipher: substitute one letter for another

plaintext: abcdefghijklmnopqrstuvwxyz
↓ ↓
ciphertext: mnbvcxz asdfghjklpoiuytrewq

e.g.: Plaintext: bob. i love you. alice
ciphertext: nkn. s gktc wky. mgsbc

Cipher text only attack
Brute force
Statistical analysis
Plain-text attack

🔑 *Encryption key*: mapping from set of 26 letters to set of 26 letters

How will you break such encryption?

Breaking an encryption scheme

good encryption scheme is hard to break w/ any of these attacks
computationally hard

- **cipher-text only attack:**

Trudy has ciphertext she can analyze

- **two approaches:**

- brute force: search through all keys
- statistical analysis

- **known-plaintext attack:**

Trudy has plaintext corresponding to ciphertext

- e.g., in monoalphabetic cipher, Trudy determines pairings for a,l,i,c,e,b,o,

- ■ **chosen-plaintext attack:**

Trudy can get ciphertext for chosen plaintext

Block Cipher

Substitution : $1 \rightarrow 1$

- Cipher: n bits \rightarrow n bits. Example: 3-bit block cipher:

Plain text

101 000

Cipher text

010 110

input	output	input	output
000	110	100	011
001	111	101	010
010	101	110	000
011	100	111	001

- How to do a brute-force attack on a 3-bit block cipher?

Easy to break with \rightarrow

2^8 ! mapping

- What is the solution?

- Use a large value of n . Say 64-bit
- The key becomes very large

$\uparrow n$
64-bit block cipher
 2^{64} bit table

64-bit Block Cipher Example

8 - different
cables

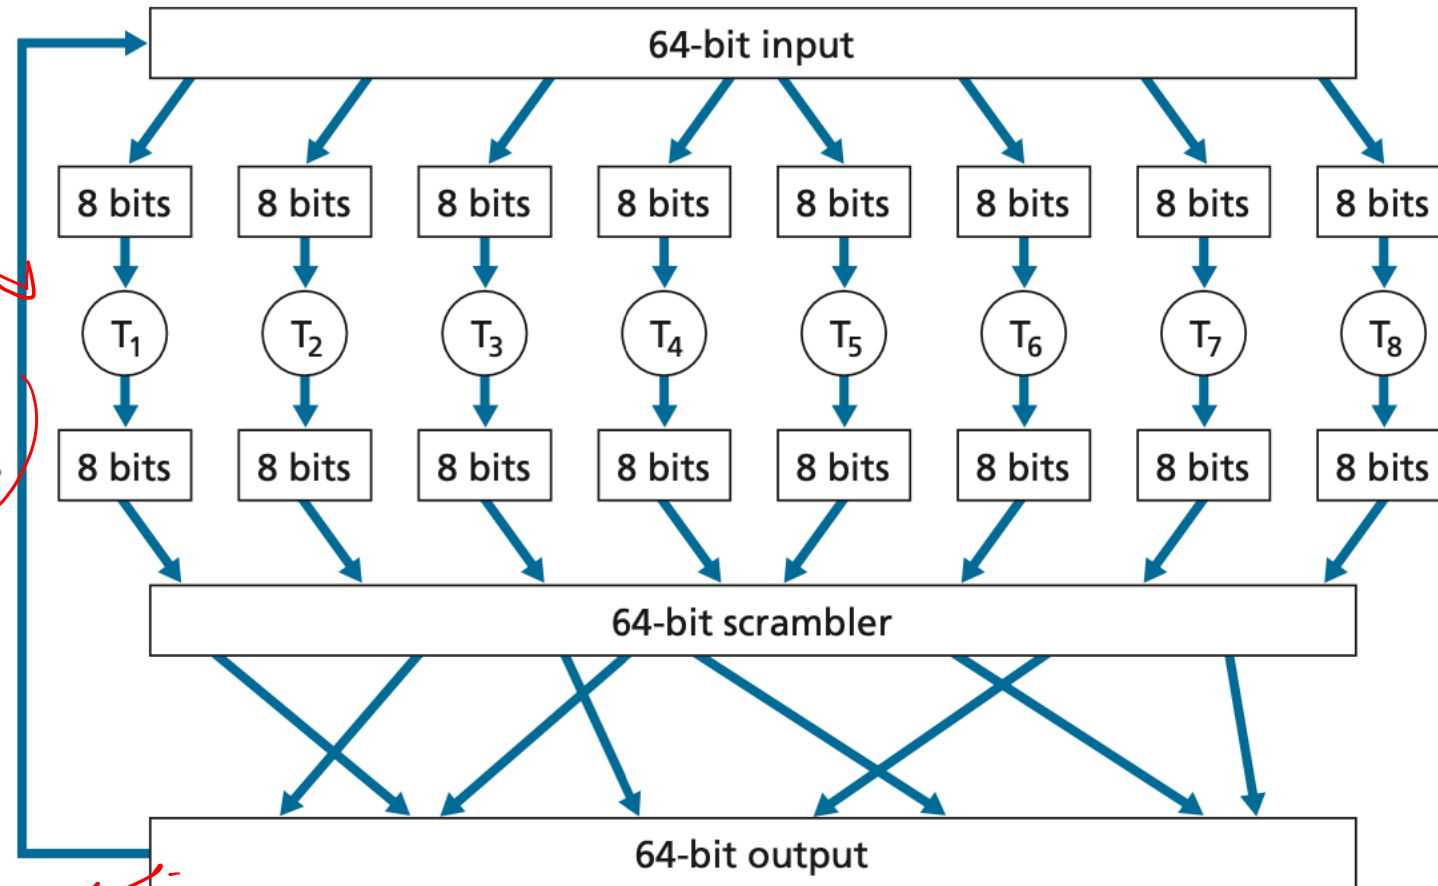

$T_1 \rightarrow T_8$

n

64-bit scrambles

Loop
for n
rounds

64-bit output

Block Cipher

- Susceptible to known plaintext attack

- For instance, two or more blocks could be "HTTP/1.1" which would lead to same ciphertext

- How to address this?

- Add some randomness into the ciphertext

encrypt

$c(1) \quad \underline{r(1)} \quad \underline{c(2)} \quad r(2), \quad c(3) \quad r(3)$

n-bit message

↓
not efficient transmission $c(2)$

$$\begin{array}{ccc} & \longrightarrow & K_s(m \oplus r) \\ (00000001) & & \\ \text{ciphertext} & \text{XOR} & \end{array}$$

$$m(i) = K_s^{-1}(c(i)) \oplus r(i)$$

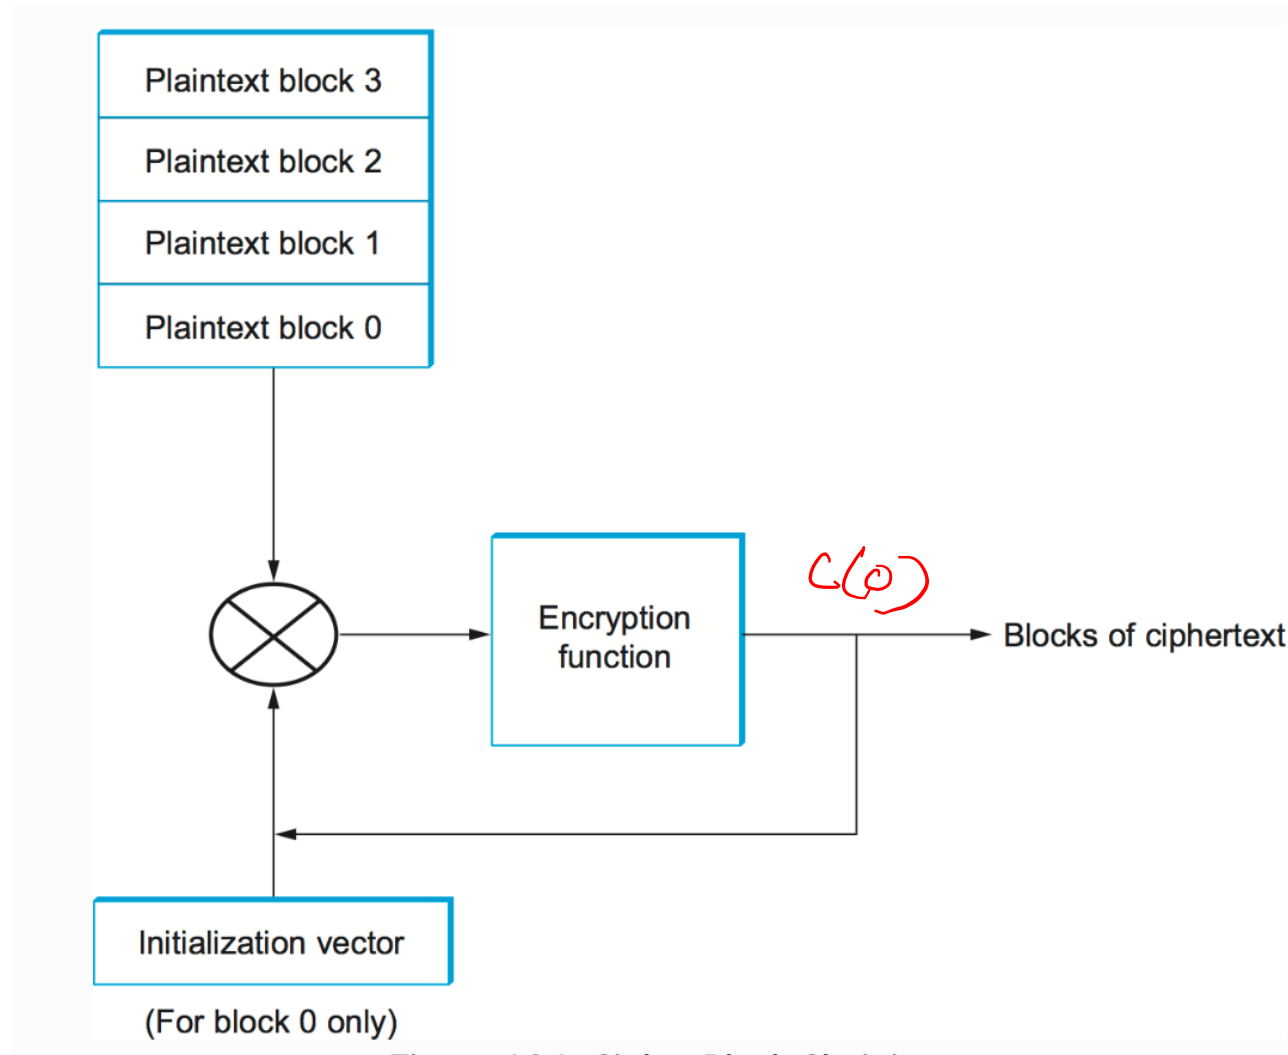

↓ id

$$\begin{array}{c} m(i) \oplus r(i) \oplus r(i) \\ \hline = m(i) \quad 000 \end{array}$$

$$m(i) \oplus c(i-1) \quad \forall i > 1$$

$$m(1) \oplus IV$$

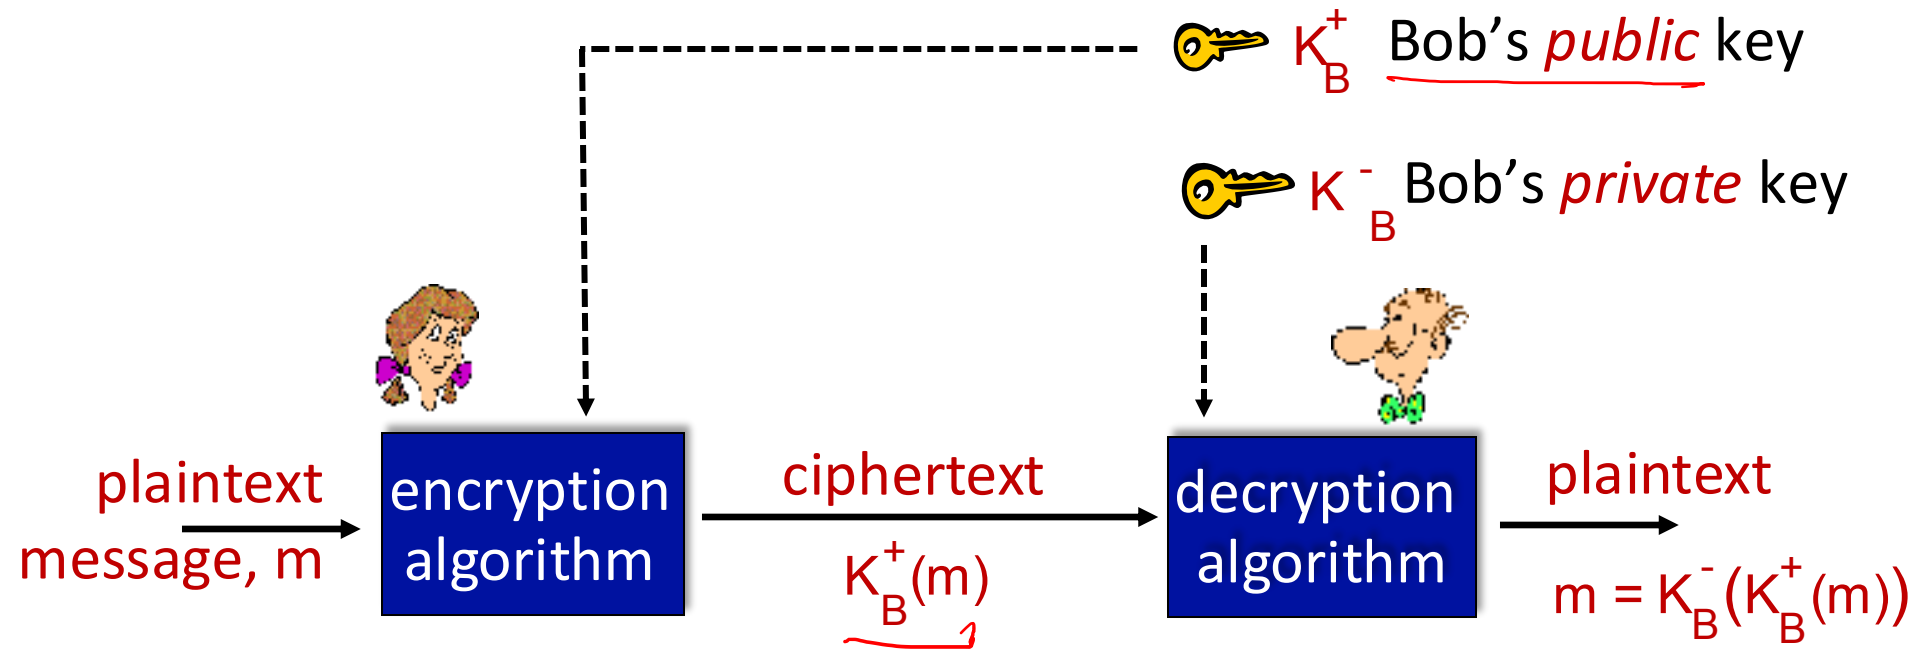

Cipher Block Chaining

Symmetric key Cryptography

- Popular symmetric key algorithms: Data Encryption Standard (DES),
128 bit Advanced Encryption Standard (AES) HTTPS / Wireless security
- Symmetric key cryptography is generally faster
- Problem: how to share secret key

Public Key Cryptography

Wow - public key cryptography revolutionized 2000-year-old (previously only symmetric key) cryptography!

- similar ideas emerged at roughly same time, independently in US and UK (classified)

Public key encryption algorithms

requirements:

① need $K_B^+(\cdot)$ and $K_B^-(\cdot)$ such that

Diffie-Hellman

$$K_B^-(K_B^+(m)) = m$$

② given public key K_B^+ , it should be impossible to compute private key K_B^-

RSA: Rivest, Shamir, Adelson algorithm
