# Recap

## ■ Transport-layer services

- Multiplexing/demultiplexing
- Reliability
- Flow Control
- Congestion control

} UDP  
TCP

## ■ Reliability

- Automatic Repeat reQuest (ARQ) protocols
  - Stop-and-wait protocol
  - Sliding window protocol

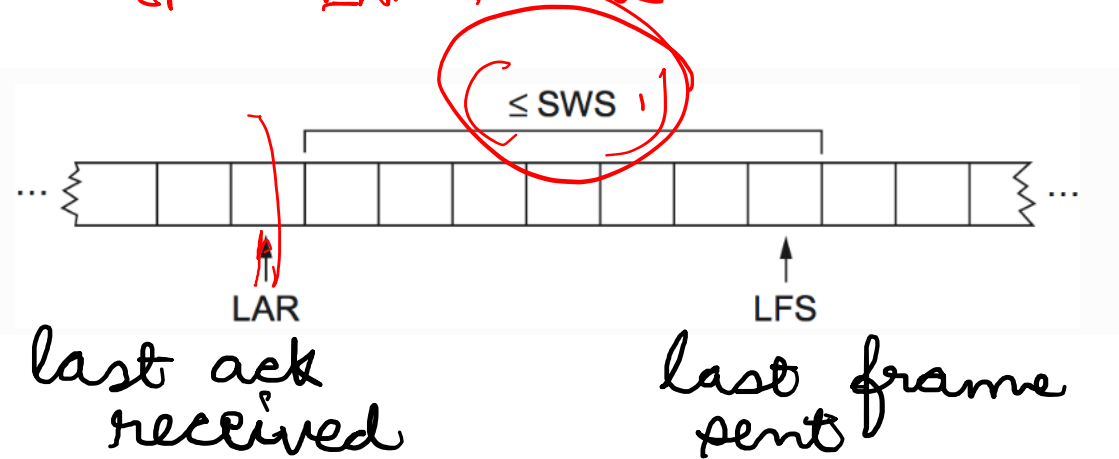

# Sliding Window Protocol

Sender window size

$$LFS - LAR \leq SWS$$

RWS

$$RWS = 1$$

$$(LAF - LFR) \leq RWS$$

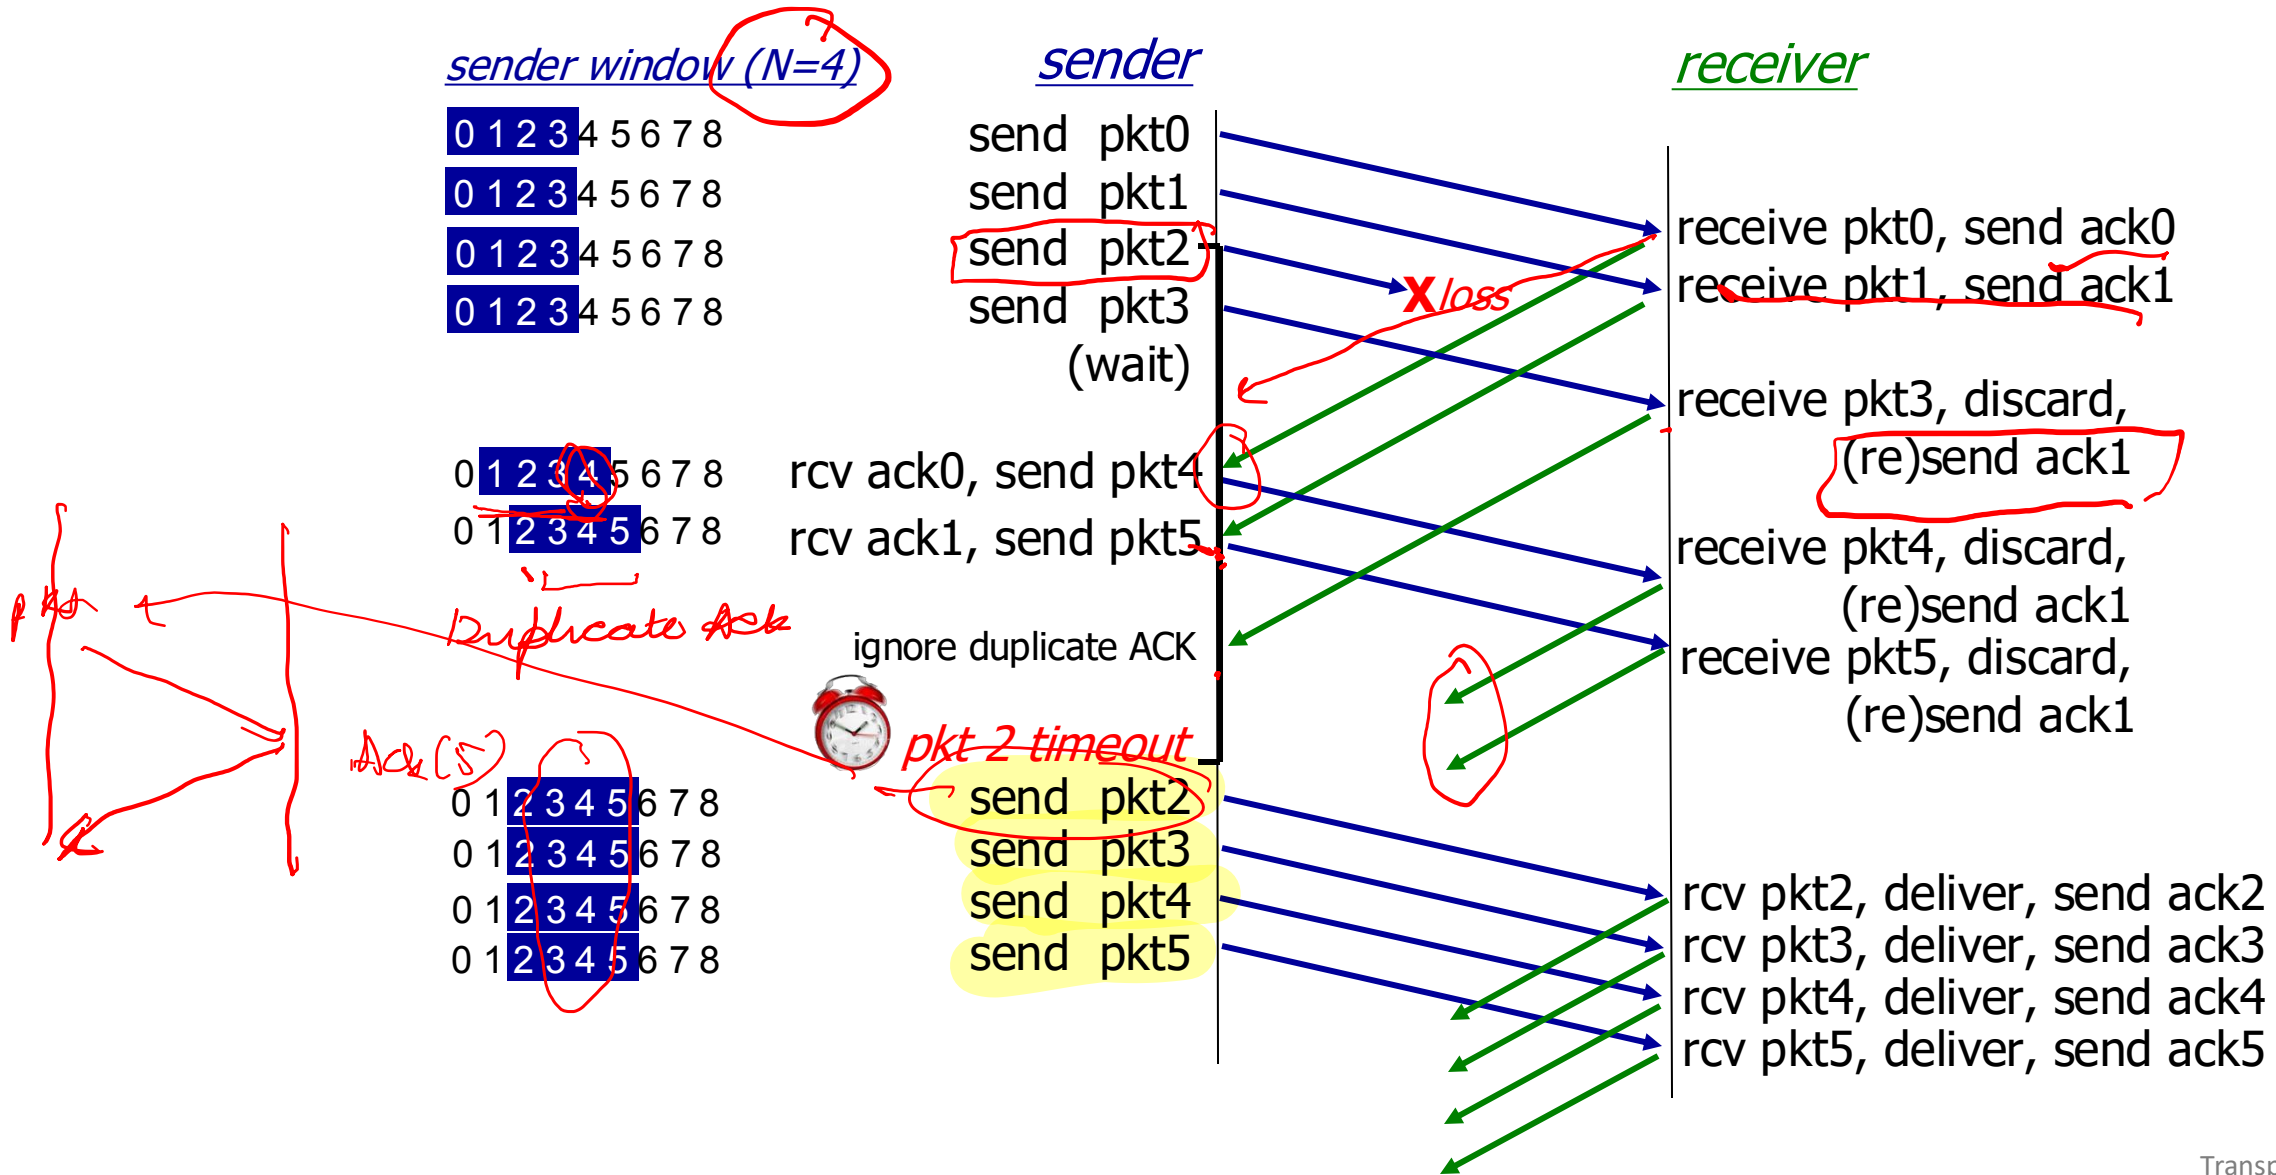

# Go-Back-N: sender

- sender: “window” of up to  $N$ , consecutive transmitted but unACKed pkts
  - $k$ -bit seq # in pkt header

- ***cumulative ACK***:  $ACK(n)$ : ACKs all packets up to, including seq #  $n$ 
  - on receiving  $ACK(n)$ : move window forward to begin at  $n+1$
- timer for oldest in-flight packet
- $timeout(n)$ : retransmit packet  $n$  and all higher seq # packets in window

# Go-Back-N in action

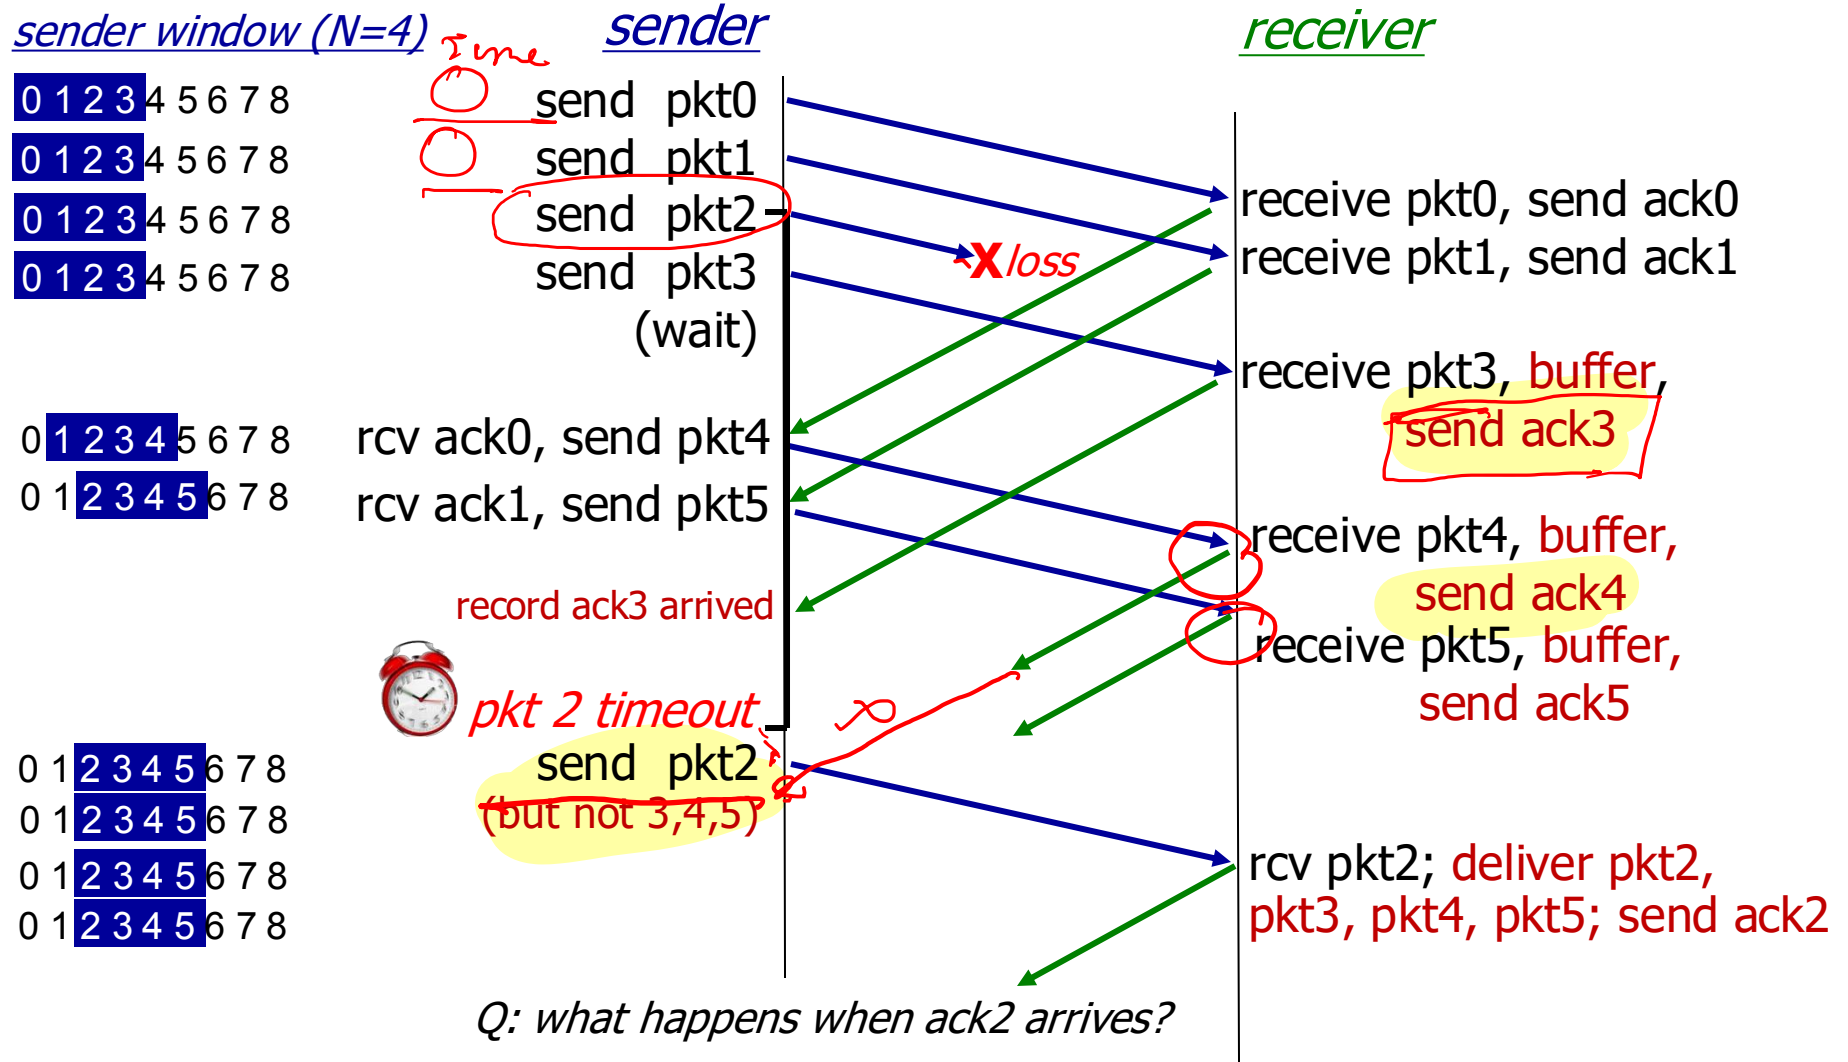

# Selective repeat: the approach

- *pipelining*: multiple packets in flight
- *receiver individually ACKs* all correctly received packets
  - buffers packets, as needed, for in-order delivery to upper layer
- sender:
  - maintains (conceptually) a timer for each unACKed pkt
    - timeout: retransmits single unACKed packet associated with timeout
  - maintains (conceptually) “window” over *N* consecutive seq #s
    - limits pipelined, “in flight” packets to be within this window

# Selective repeat: sender, receiver windows

# Selective Repeat in action

# Selective repeat: a dilemma!

example:

- seq #s: 0, 1, 2, 3 (base 4 counting)
- window size=3

Seq #  $\rightarrow$  K-bit header

sender window  
(after receipt)

receiver window  
(after receipt)

(a) no problem

(b) oops!

# Selective repeat: a dilemma!

example:

- seq #s: 0, 1, 2, 3 (base 4 counting)
- window size=3

Q: what relationship is needed  
between sequence # size and  
window size to avoid problem  
in scenario (b)?

sender window  
(after receipt)

receiver window  
(after receipt)

- receiver can't see sender side
- receiver behavior identical in both cases!
- something's (very) wrong!

(b) oops!

# Transport Control Protocol

- Connection-oriented
- Reliability and in-order delivery
- Flow control
- Congestion control

# Connection-oriented transport: TCP

Bi-directional

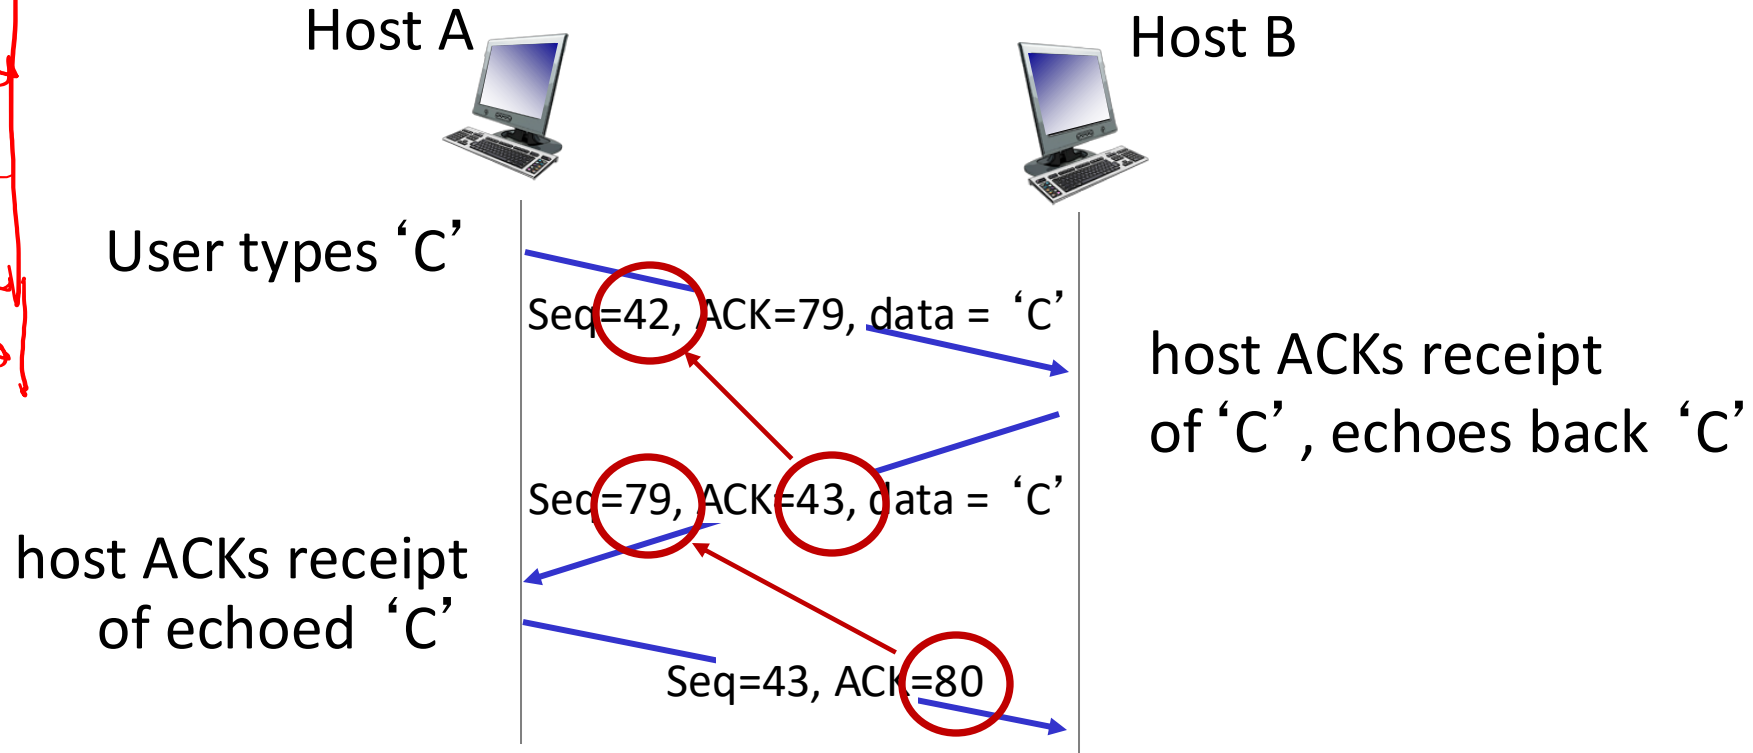

Id. of processes (SRC IP, DST IP)  
32 bits

source port #	dest port #
sequence number	
acknowledgement number	
<div><div></div><div></div><div></div><div></div><div></div><div></div><div></div><div></div><div></div><div></div><div></div><div></div><div></div><div></div><div></div><div></div></div>	

# TCP sequence numbers, ACKs

Randomized  
Seq #

simple telnet scenario

# TCP sequence numbers, ACKs

## Sequence numbers:

- byte stream “number” of first byte in segment’s data

## Acknowledgements:

- seq # of next byte expected from other side
- cumulative ACK

Q: how receiver handles out-of-order segments

- A: TCP spec doesn’t say, - up to implementor

outgoing segment from sender

source port #	dest port #
sequence number	
acknowledgement number	
	rwnd
checksum	urg pointer

outgoing segment from receiver

source port #	dest port #
sequence number	
acknowledgement number	
	rwnd
checksum	urg pointer

# TCP connection management

before exchanging data, sender/receiver “handshake”:

- agree to establish connection (each knowing the other willing to establish connection)
- agree on connection parameters (e.g., starting seq #s)

```
Socket clientSocket =  
    newSocket("hostname", "port number");
```

```
Socket connectionSocket =  
    welcomeSocket.accept();
```

# Agreeing to establish a connection

2-way handshake:

- Q: will 2-way handshake always work in network?
- variable delays
  - retransmitted messages (e.g. req\_conn(x)) due to message loss
  - message reordering
  - can't "see" other side
- Handwritten notes in red ink include: "Req(conn)" and "Ack(conn)" with arrows, and "Req(conn)" and "Ack" with arrows, suggesting a sequence of events or a sequence of messages.

# 2-way handshake scenarios

# TCP 3-way handshake

## Client state

```
clientSocket = socket(AF_INET, SOCK_STREAM)
```

LISTEN

```
clientSocket.connect((serverName, serverPort))
```

SYNSENT

ESTAB

choose init seq num, x  
send TCP SYN msg

SYNbit=1, Seq=x

choose init seq num, y  
send TCP SYNACK  
msg, acking SYN

SYNbit=1, Seq=y  
ACKbit=1; ACKnum=x+1

received SYNACK(x)  
indicates server is live;  
send ACK for SYNACK;  
this segment may contain  
client-to-server data

ACKbit=1, ACKnum=y+1

received ACK(y)  
indicates client is live

## Server state

```
serverSocket = socket(AF_INET, SOCK_STREAM)  
serverSocket.bind(('', serverPort))  
serverSocket.listen(1)  
connectionSocket, addr = serverSocket.accept()
```

LISTEN

SYN RCVD

ESTAB

# Closing a TCP connection

- client, server each close their side of connection
  - send TCP segment with FIN bit = 1
- respond to received FIN with ACK
  - on receiving FIN, ACK can be combined with own FIN
- simultaneous FIN exchanges can be handled
